

# Changing only the instruction changed what the robot did

π0.5 on LIBERO Object and Goal: 1,200 closed-loop rollouts; each heat-map cell is 20 official initial states.

a Controlled stimulus

Same camera image, robot state, and action noise; only the instruction changes.

PAIR 1 — SAME OBJECT SCENE

“pick up the cream cheese and place it in the basket”  
versus  
“pick up the tomato sauce and place it in the basket”

Correct: 20/20 success  
Conflict: 0/20 success; tomato sauce first 20/20

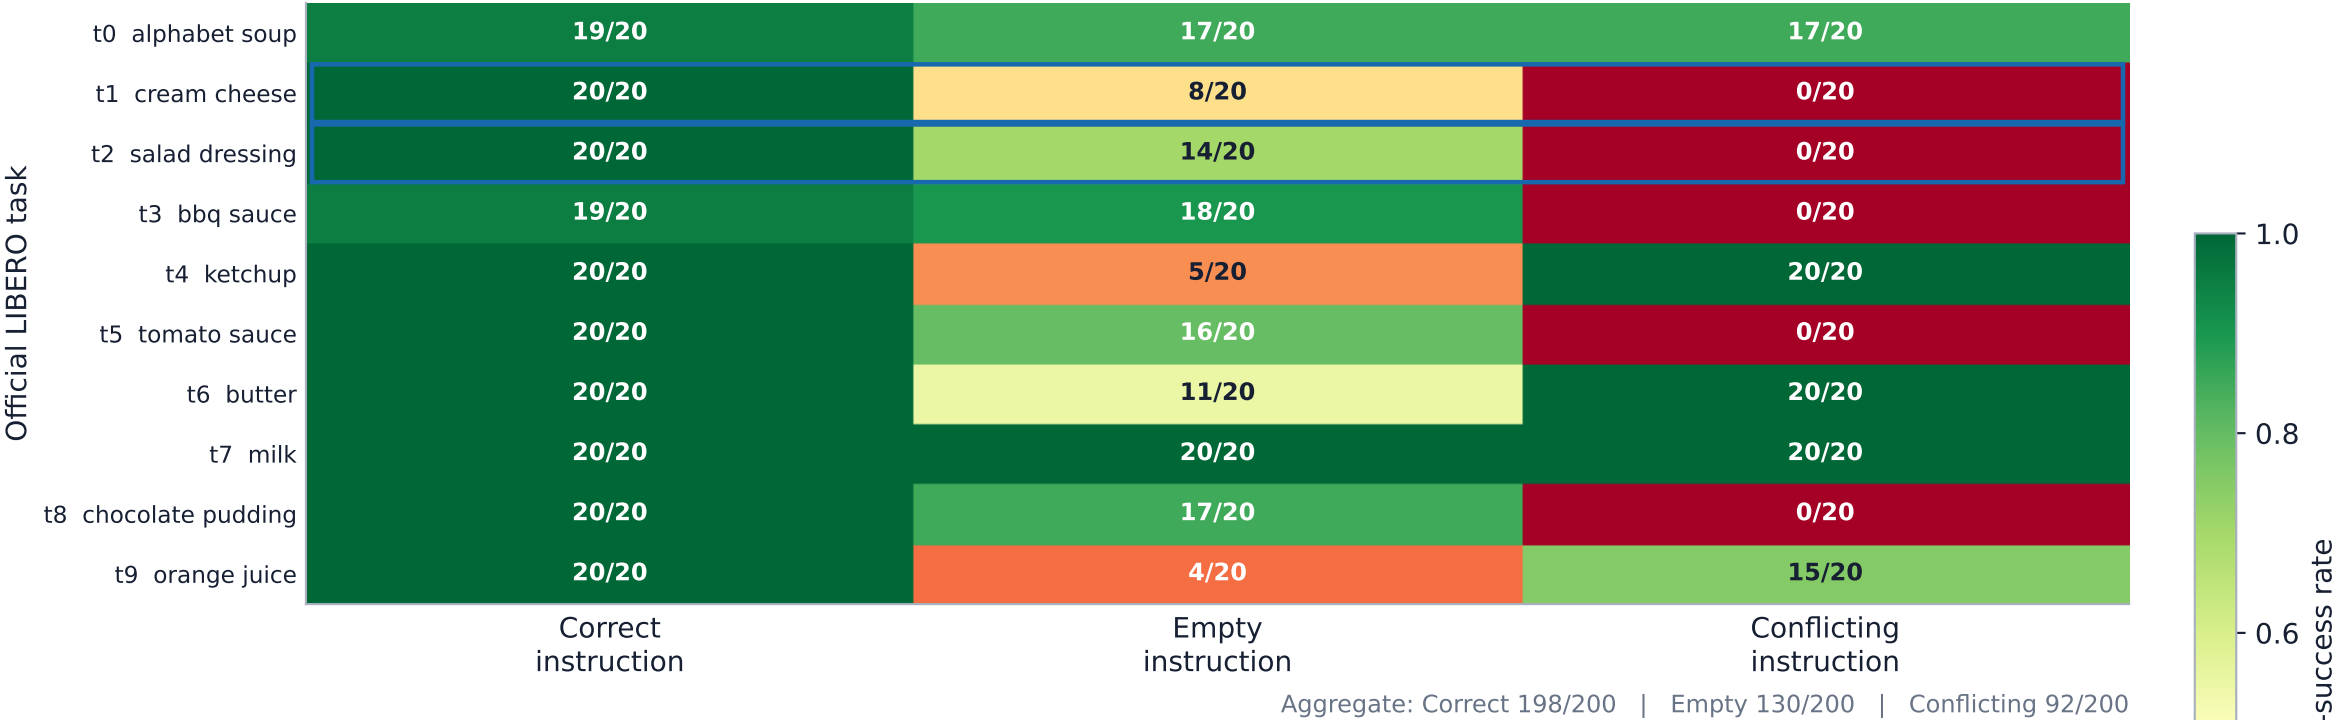

PAIR 2 — SAME OBJECT SCENE

“pick up the salad dressing and place it in the basket”  
versus  
“pick up the ketchup and place it in the basket”

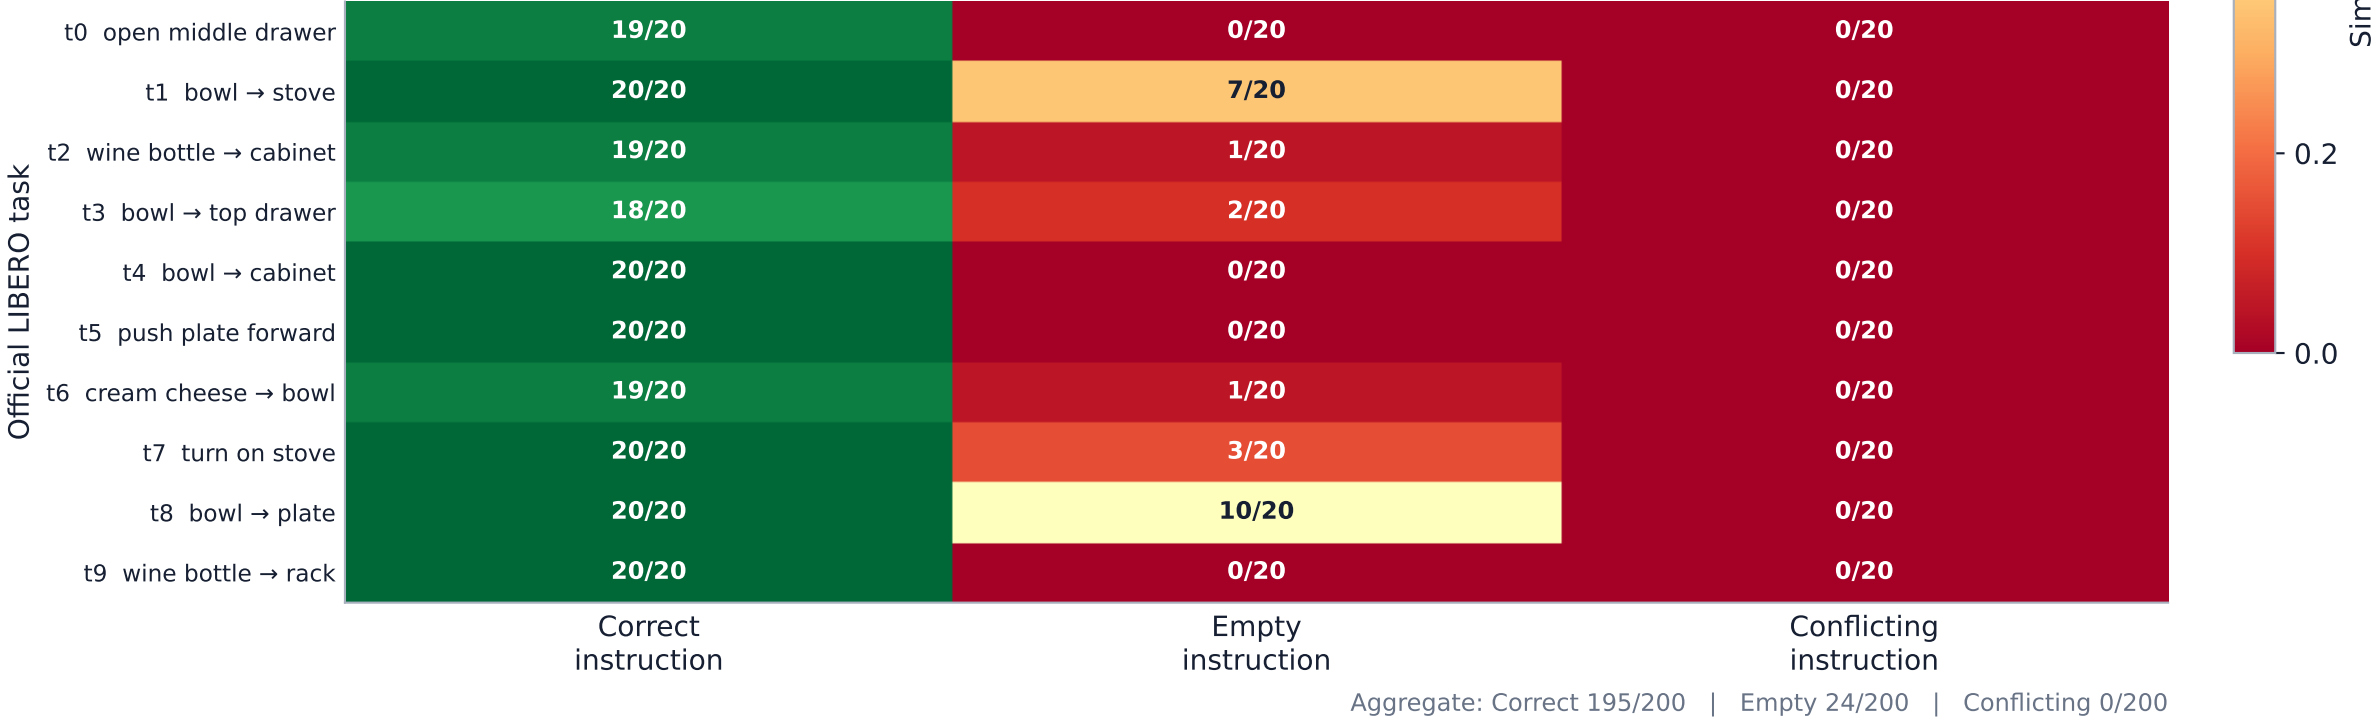

Correct: 20/20 success  
Conflict: 0/20 success; ketchup first 20/20

**“A conflicting instruction can redirect first contact even when the physical scene is unchanged.”**

b LIBERO Object: some tasks persist without the right instruction

c LIBERO Goal: behavior depends strongly on the instruction

Under conflicting prompts, the robot touched the named alternative first in 55/200 Object rollouts and 185/200 Goal rollouts. The heat map shows success on the scene's original task, not generic motion.
