

The same scene: prompt conflict fails, late-state repair succeeds

$\pi 0.5$, LIBERO Object task 1, initial state 20; independent closed-loop runs share the registered scene and noise-seed rule.

a **Conflicting prompt**

“pick up the tomato sauce...”

tomato sauce first • task failed

b **Correct prompt**

“pick up the cream cheese...”

cream cheese first • task complete

c **Late-state repair**

external prompt still names tomato sauce

cream cheese first • task complete

d **Early-layer control**

same transplant at layers 0–5

tomato sauce first • task failed

At every replan, the repair copies only all 512 image-position K/V entries from the same-observation correct-prompt donor. No donor action or stored trajectory is copied. All four recaptures match the archived outcomes.
