

$\pi 0.5$ resists compact edits: a large action shift appears only at the full image field

Image-position K/V at layers 12–17 · 8 directed prompt-pair cells × 3 initial states · fixed pixels, robot state, and action noise.

Lines: descriptive median over 24 scene-direction rows. Bands: interquartile range over eight directed prompt-pair medians (three initial states each). At 512 positions the two selections are identical. R is target-axis progress, not full-vector similarity.
